

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Brainstorming & Ideation

Project Idea

- Develop a ServiceNow access-control solution that restricts record access according to a field value.
- Use the Branch field in Institution Details records to control which records a user can access.
- Combine user roles and ACL rules to enforce record-level security.

Core Concept

- The project focuses on script-controlled READ, CREATE, WRITE, and DELETE ACLs.
- The access decision uses the user's role together with the record's branch value.
- The intended restricted branch used in the lab is EEE.
